

Credit Name: Zubair Bechir																		
Assignment Name: Chapter 10																		
The following questions can help you in thinking critically about your problem-solving processes:																		
Understanding the Problem																		
How did you approach understanding the challenge?										I read each question carefully and looked at what the program was asking me to do. For the bigger programs, I focused on one part at a time, like the arrays, loops, and game rules.								
Were there any parts of the problem you found confusing at first? If so, how did you resolve that confusion?										Yes, I broke the code into smaller steps. I used arrays, loops, and if statements because they fit the problems.								
Planning the Solution																		
Did you create a plan or break the problem into smaller steps before coding?										Yes, I broke the code into smaller steps.								
How did you decide on the tools, data structures, or algorithms to use?										I used arrays, loops, and if statements because they fit the problems.								
Implementation																		
Did you write the code in small pieces or attempt the entire solution at once?										I wrote the code in smaller parts instead of all at once.								
How did you test your solution along the way to make sure it was working?										I tested it by running the program and checking the output.								
Overcoming Challenges																		
What part of the problem was the most difficult for you?										The hardest part was keeping track of array positions.								
How did you handle moments when you felt stuck or unsure of what to do next?										When I got stuck, I checked my code step by step.								
Learning																		
Was there anything you learned that you think will help you with future challenges?										I learned that arrays and loops make it easier to organize and work with lots of data.
