

Files and Exception Handling

Critical Thinking — Questions 1–10

The matching questions appear on printed page 331 in the linked edition, rather than page 300.

1. No. Memory is temporary; a file stores related data on a persistent medium.

2. `import java.io.File;`

3. The backslash must be escaped:

```
File textFile = new File("c:\\inventory.txt");
```

4. a) A try-catch-finally statement.

b)

```
try {
```

```
    File textFile = new File("inventory.txt");
```

```
    textFile.createNewFile();
```

```
} catch (IOException e) {
```

```
    System.out.println("Unable to create the file.");
```

```
    System.err.println(e.getMessage());
```

```
}
```

This assumes `import java.io.*;` appears above the class.

5. a) `System.err`.

b) Usually in the console.

6. a) The current file position where reading or writing occurs.

b) A carriage return (`\r`) and a line feed (`\n`) form the textbook's line terminator.

7. `FileWriter` and `BufferedWriter`.

8. Assuming the string is named `balance`:

```
totalBalance += Double.parseDouble(balance);
```

9. Serialization writes an object's data to a file. Deserialization reads that data to reconstruct the object.

10. The class must implement `Serializable`.
